# American Psychiatric Association (APA) Guidelines

APA has long history of publishing treatment recommendations

Guidelines are patient care strategies to assist physicians in clinical decision making

Since 1991, APA committed resources to developing practice guidelines

# American Psychiatric Association (APA) Guidelines

APA Guidelines Committee supervises process

Work group of clinical and research experts conduct a rigorous review of scientific literature

Input obtained from numerous external organizations

Final approval by APA Assembly and Board

Revised at least every 5 years and updated as needed

## DSM-IV Diagnostic Criteria

Opiate use exists on a spectrum of use, misuse, abuse, and dependence.

Dependence is a pattern of opiate use leading to impairment or distress over a 12 month period with at least 3 of the following 7 items:

## DSM-IV Dependence Criteria continued

- 1) Tolerance
- 2) Withdrawal
- 3) Taking more than intended
- 4) Persistent desire to control use
- 5) Spending a lot of time with it
- 6) Giving up important activities
- 7) Use despite recurrent problems

# Settings for Opiate Dependence Treatment

Therapeutic Communities

Residential Rehabilitation Programs

Outpatient clinics and offices

Opioid Treatment Programs

Self-help (Narcotics Anonymous)

## Settings for Opiate Dependence Treatment

Recommendations depend on the patient characteristics and preferences, costs, and available alternatives.

Preference for the least restrictive setting that is likely to be safe.

American Society of Addiction Medicine (ASMA) Patient Placement Criteria can be used to guide recommendations.

# Psychosocial Treatment Approaches

Clinical Trials of psychosocial treatments were all conducted in conjunction with medications

Cognitive Behavioral Therapy

for patients with co-morbid depression

Contingency Management

Family Therapy

can assist with medication adherence

# Approved Medications for Opiate Dependence Treatment

Methadone (oral)

Buprenorphine (sublingual)

Naltrexone (oral)

Extended Release Naltrexone (injection)

# What is the difference between opiate agonists & antagonists?

# Methadone and Buprenorphine

- Activate the opiate receptors
- Reduce heroin craving
- Alleviate withdrawal
- Block heroin's euphoric effects

# What is the difference between heroin addiction and opiate agonist treatment?

# Where are methadone & buprenorphine provided?

## Opioid Treatment Programs (OTPs)

- Methadone (mostly) or buprenorphine
- Counseling & drug testing
- Direct observed therapy
  - Take home doses contingent on performance

# Where are methadone & buprenorphine provided?

## Outpatient Programs or Physician Offices

- Buprenorphine (not methadone)
  - Prescriptions with pharmacy pick-up
- Counseling & drug testing on-site or by referral

# How are buprenorphine & methadone provided?

- Shorter-term: Detoxification
- Longer-term: Maintenance
- Length of time on medications should be individually determined by patient and physician

# Is Detoxification Effective?

---

- Reduces withdrawal symptoms
- Helps some patients detoxify
- Most patients relapse quickly after detoxification  
29% success at 2 weeks post-detox (Ling et al, 2005)
- Relapse is association with increased risk of overdose death

# Is Opiate Agonist Maintenance Treatment Effective?

Many studies show it is effective in reducing:

- Heroin use
- Criminal activity
- HIV risk behavior

# What are the Characteristics of Effective Maintenance Treatment?

- Higher individualized doses
- Longer time in treatment

# Buprenorphine/Naloxone vs. Buprenorphine Alone

---

## Combination of buprenorphine with naloxone (Suboxone):

- Sublingual buprenorphine has well absorbed
- Addition of naloxone to buprenorphine to decreases its abuse potential (injection precipitates withdrawal)

## Buprenorphine Alone (Subutex):

- Rare indications for use

# Opioid Antagonist Treatment

## Oral Naltrexone

- Highly effective pharmacologically
- Hampered by poor patient adherence
- Useful for highly motivated patients

## Extended release Naltrexone (Injection)

- Effective for about 30 days
- Trial by Krupitsky and colleagues (2011) in Russia was used for US approval

# Novel Studies in Baltimore of Opiate Treatments

- Baltimore is a city of 450,000 residents  
estimated 10% are drug dependent
- High overdose death and HIV infection rate
- We conducted two randomized trials of treatments building on guidelines with potential for scaling up for public health impact

# Methadone Alone vs. Waiting List (N = 319)

## Percent Opiate Positive Drug Tests

(Schwartz et al., 2006; 2007)

# Pre-Prison Release Methadone Clinical Trial Opiate Positive Rates at 12-Month Follow-Up

Kinlock et al., 2009

## Summary

APA guidelines are a useful tools for clinicians and policy makers

They can be built upon by clinical researchers to find ways to apply evidence-based treatments which have the potential to be brought to scale for public health impact
